

Sustainable Products - Definition Wood

The purpose of this document is to be a support when we are about to select the products that we define as sustainable products within **wood**.

To offer our customer a sustainable product is important from both an environmental- and a business perspective. We base our definition on three important aspects:

- Economy - encourage businesses to make investments creating longterm growth without harming the environment or society.
- Society - encourage companies to improve by complying with human rights and environmental laws.
- Environment - encourage companies to manage our natural resources correctly and minimize environmental impact.

Sustainable products provide environmental, social, and economic benefits throughout the life cycle.

Below you find our definition of a sustainable product within Wood.

General definition

The true value of the forest is fully recognized and integrated into communities around the world. **FSC®** is the leading driving force for improved forestry and market development, which turns the trend in the world's forests towards sustainable use, conservation, and respect for all.

PEFC is the world's largest certification system for sustainable forestry. The PEFC label on a wood-based product shows that it is made from forest raw materials from sustainably managed forests in accordance with PEFC's requirements. ISPM 15 is an international standard which means that marked wooden packaging is treated against plant pests. This reduces the risk of pests that can threaten trees and forests spreading with wooden packaging through world trade. Within the EU, the stamp can also be used on wood, which will later be used to manufacture ISPM 15-marked wood packaging.

Boxon definition

To be defined as a sustainable product we require that:

- The supplier should be certified according to FSC or PEFC
- The product should be marked/stamped/treated according to IPPC / ISPM 15 / KD
